

Title: AI Tool Prompt Engineer Report

AI Tool Overview

- GPT Image 1.5
- Purpose: The purpose of this creation is to put things from my imagination into an image.
- The reason why I chose GPT Image 1.5 is due to its capability of adding an image to the prompt so the ai have reference.

Original Prompt

Prompt

Output

AI-Assisted Prompt

- LLM Used: ChatGPT
- Improved Prompt: A hyper-detailed, cinematic scene of a massive, battle-scarred dinosaur riding a futuristic Gundam mech, charging into combat against a towering, destructive Godzilla. The battlefield is in total chaos—massive explosions erupt in the background, fire and debris filling the air, with smoke clouds glowing from intense energy blasts.

In the distance, Conquest from Invincible is lifting an enormous skyscraper above his head, adding to the sense of overwhelming power and destruction. The environment is a ruined cityscape at dusk, with dramatic lighting, glowing embers, and sparks flying everywhere.

Style: ultra-realistic, dark, gritty, highly detailed, cinematic lighting, 8K resolution, dynamic action pose, motion blur, volumetric lighting, sharp focus, epic scale, “hardest image ever.”

- Output:

Comparison and Analysis

- Generating my original prompt and AI-Assisted code does have a difference in quality. Starting with my original, my prompt consists of 3 very simple and straightforward prompts, and the output of the original prompt is more bright and flat but it did correctly generate the gundam mech, godzilla and the dinosaur. But the character conquest from the tv animated show invincible is generated wrong compared to the original character which is expected because i left out details when i was prompting the image which should be considered when prompting to generate the output you are expecting. Now the AI-Assisted prompts is more detailed, more in depth, the character design of the dinosaur, gundam mech, and godzilla is more detailed, and i noticed now that there is a city in the background, its not bright and not flat as the first original prompt output, the fire is more impactful and fluid. And comparing the original prompt and the AI-Assisted prompt, the AI-Assisted prompt assisted my ChatGPT is more, it has more content, more detail, more sentences compared to my original prompt, it has 3 paragraphs explaining even the resolution of the image and the theme. It also prompted the styles saying "Style: ultra-realistic, dark, gritty, highly detailed, cinematic lighting, 8K resolution, dynamic action pose, motion blur, volumetric lighting, sharp focus, epic scale, "hardest image ever." which explain the more indepth dynamic look and feel of the image generated with the prompt assisted by ChatGPT. So yes, AI-assisted prompt does assist with the quality of the generated picture but original prompt can also be a better option than the AI-Assisted prompt. Let me explain, sometimes if you use an AI-Assisted prompt it will possibly alter your expected output by adding things you don't want or removing things you need for your expected outcome. So the original prompt can be really powerful if you give it more detail, explain more, type all the details needed, not just general details, in depth details so the AI can spit out and generate the prompt you wanted and expected.
